Project Claims

Due to the higher population in Asian countries, students are strongly motivated by the competitive environment. This competition forces students to be self-regulated learners and start learning harder by themselves. This might be the practical and inevitable model for all developing countries, which demand a large number of human resources instantly.

Another factor that compels a student to make a decision and start learning is peer influence. Teens are all generally influenced by their peers. By utilizing peer influence smartly, it can lead teenagers to engage in new positive activities.

People who disagree with competition and peer influence may claim that teenager does not deserves to be under pressure, which can erode their mental health and cause so many problems in a long run. The education should be not only feeding knowledge into students' brains but also enhancing their lives.
